For more than 40 years, the environmental justice movement has shown that communities of color, low-income communities, and indigenous groups are differentially burdened by environmental hazards, noxious land uses, and pollution leading to poor health outcomes and health inequities. Unfortunately, the disproportionate burden of hazards, pollutants, and health risks can be linked to environmental racism—racial discrimination in zoning and planning, environmental policymaking, and enforcement of laws and regulations. In this lecture, Dr. Wilson will discuss examples of environmental racism and oppression in the 21st Century Jim Crow America. He will describe current efforts in US politics to further weaken environmental laws and regulations and implement economic policies that will drive additional environmental injustice and health problems in communities currently impacted by environmental racism and slavery and expose other groups on the social, economic, and political margins to environmental injustice.
